SOC CMM Assessment System

A web platform for running Security Operations Center maturity assessments — built on the SOC-CMM® framework, bilingual in English and Portuguese.

github.com/fernando-karl/soc_cmm_system

Built on the SOC-CMM® framework by Rob van Os · Not affiliated with soc-cmm.com

Measure how mature a SOC really is — and watch it improve

Guided assessments across the five SOC-CMM® domains, scored on the 0–5 maturity scale, with radar reporting per domain and repeat assessments that track progress over time.

Multi-client

Several organisations per account, each scoped to its owner.

Bilingual

The full interface in English and Brazilian Portuguese.

Self-hosted

FastAPI and SQLite. Docker, or one Python command.

The model was solid. The workflow was a spreadsheet.

BEFORE

- One workbook per client, emailed around
- No history between assessments
- Charts rebuilt by hand each time
- English only

WITH THE PLATFORM

- Guided, resumable questionnaire
- Every assessment kept and comparable
- Scoring and charts generated
- English and Portuguese

Five domains, twenty-seven aspects, 622 scored questions

Business

Drivers, customers, charter, governance, privacy

People

Employees, roles, management, knowledge, training

Process

Management, operations, use cases, detection engineering

Technology

Log, network and endpoint monitoring, SecOps automation

Services

Monitoring, incident management, forensics, intelligence, hunting

Results

The output of the five domains — not scored as a domain of its own

Every question carries the framework's own description of what each maturity level means for it, and its NIST CSF 2.0 mapping.

THE WORKFLOW

A guided questionnaire, not a wall of questions

The assessment is broken into one of the five domains at a time, then one aspect at a time. Progress is shown per aspect and per domain, answers save as you go, and an assessment can be left and resumed.

- Five numbered steps, one per domain
- Per-aspect completion percentages
- The framework's own guidance on each question

The screenshot displays the 'SOC CMM Assessment' interface. At the top, a navigation bar includes 'SOC CMM', 'Home', 'Customers', 'Dashboard', 'Users', and buttons for 'Eng', 'Port', and 'Demo Analyst'. Below the navigation bar, the title 'SOC CMM Assessment' is followed by a 'Save & Exit' button. The user information 'Customer: Acme Financial | Organization: Acme Financial Group' is displayed. A progress bar indicates 'Step 1 of 5: Business Domain' with '20 of 28 questions answered (71%)'. A horizontal navigation bar shows five steps: 1 Business, 2 People, 3 Process, 4 Technology, and 5 Services. The 'Business Domain' section is highlighted in blue, with the subtitle 'Business domain of the SOC-CMM framework'. Below this, a section titled 'Select an aspect to evaluate:' lists three aspects: 'Business Drivers', 'Customers / Stakeholders', and 'Charter'. Each aspect has a progress bar showing 100% completion: 'Business Drivers' (5 of 5 questions answered), 'Customers / Stakeholders' (6 of 6 questions answered), and 'Charter' (4 of 4 questions answered).

Assessment: 2025 H2 Re-assessment | Completed: 2026-10-07 19:16:11

General Maturity of SOC

2.5/5.0

Average Maturity

Radar Chart of Maturity

Visualization of maturity across all domains

REPORTING

One number, then the shape behind it

An overall maturity score opens the report, and the radar chart immediately shows which of the five domains carry it and which drag it down.

Scores are computed from the maturity level of each answered option, averaged up through aspects to domains.

Every domain and aspect, with its maturity level named

Scores are reported as a number and as the framework's own label — Defined, Managed, Optimizing — so a reader does not have to remember what 4.0 means. Every aspect carries the name the spreadsheet gives it.

OVER TIME

A maturity programme, not a one-off audit

Each completed assessment becomes a point per domain, so a re-assessment shows movement rather than a single new number.

ENGLISH · PORTUGUÊS

The language barrier is a real obstacle to adoption

SOC-CMM® is published in English. For many teams in Brazil that alone is enough friction to stop an assessment before it starts.

The entire interface — navigation, questionnaire, results and the attribution notice — switches between English and Brazilian Portuguese.

A REST API, and an MCP server for AI assistants

REST API

Clients, assessments, the questionnaire, answers and scores are all reachable over HTTP with a bearer token — enough to drive the whole workflow from a script.

MCP server

A Model Context Protocol server lets an AI assistant create a client, walk through the questionnaire, record answers and read back the scores.

```
export API_TOKEN='<bearer token>'  
python mcp_server.py
```

ACCESS CONTROL

A client's SOC weaknesses are sensitive data

Assessment results describe exactly where an organisation's defences are weakest. Every customer- and assessment-scoped endpoint requires authentication and verifies that the record belongs to the caller.

Scoped per owner

One ownership check, called from every endpoint that touches client data.

Proven by tests

A second tenant gets 403, an anonymous caller 401 — asserted on every endpoint.

Run in CI

The suite builds its own database and runs on every push.

BUILT ON SOC-CMM®

A derivative work, licensed the same way

The domains, aspects, questions and maturity levels come from the **SOC-CMM® framework v2.4.2 (advanced)** by **Rob van Os**, published under CC BY-SA 4.0.

In compliance with ShareAlike, this entire project — code, database content, documentation and the Portuguese translation — carries the same license.

Clone it, run it, contribute

Run it

```
git clone .../soc_cmm_system
pip install -r requirements.txt
python main.py
```

Or **docker compose up**. Python 3.11+, SQLite, no external services.

Help wanted

- A first-run database bootstrap
- Broader test coverage
- More languages beyond EN and PT-BR
- Export to PDF and spreadsheet
